

Fake News Detection in the Real World: Addressing Posts with Cold Users

First the dataset is downloaded from <https://github.com/entitize/Fakeddit>. The dataset is organized as follows in the current project folder.

Folder Structure :

```
|
|
| — Fakeddit                      # Dataset Folder
|   |
|   | — all_train.tsv
|   | — all_test_public.tsv
|   | — all_valid.tsv
|   | — all_comments.tsv
|
| — Generate_User_Embed.ipynb    # Generates user representation for each train user
| — Preprocess_Dataset.ipynb    # Generates content + user behavior representation
| — Graph_Classification.ipynb  # Graph classification using different GNN models
| — Cold_User_Mapper_Module.ipynb # Approximating representation for cold users
```

Requirements :

The project majorly relies on the following libraries:

1. Optuna
2. Faiss
3. Pytorch
